OR=odds ratio; CI=confidence interval; † Adjusted for age, sex; ‡ Adjusted for age, sex, education, marital status, occupation, smoking, diabetes mellitus, hyperlipidemia, frequency of drinking, typical drinking quantity.

After correction

The odds ratio of hypertension for risk drinkers with abdominal obesity was 4.81 compared to non-risk drinkers with normal waist circumference, whereas the odds ratios of hypertension for risk drinkers with normal waist circumference and non-risk drinkers with abdominal obesity were 1.58 and 2.37 respectively.

2) p. 353 - Table 1. Characteristics열의 12줄

Before correction

The odds ratio of hypertension for risk drinkers with abdominal obesity was 4.81 compared to non-risk drinkers with normal waist circumference, whereas the odds ratios of hypertension for risk drinkers with normal waist circumference and non-risk drinkers with abdominal obesity were 1.58 and 2.37 respectively.
